

1 Point Perspective

1 Point Perspective drawing is generally considered the most basic of all types of perspective. You can accurately create a believable scene using a single "**Vanishing Point**" for converging lines, located on a "**Horizon Line**". All you need is a ruler and a pencil.

Vanishing Point – Where all lines converge

Horizon Line – The line that indicates the midpoint of your scene.

Carefully recreate the drawing on page one.

- 1) Using a ruler, draw a horizon line.
- 2) Draw Figure 1. Connect the sides of the rectangle to the Vanishing point as shown in the example. Include the dotted lines representing the backside of the shape.

- 3) Draw Figure 2. Extend the edges, but bring them up just short of the vanishing point.

- 4) Draw Figure 3. Extend the edges approximately halfway to the vanishing point. Draw the dotted lines that indicate the end of the box.

5)

- 6) Draw Figure 4. Create the illusion that this box is floating in space, with no dotted lines connecting it to the vanishing point.
